Local weather has been perfect for the production, incubation and infection of corn and soybean fungi.

Proper identification and application timing of fungicides will be critical in keeping your entire potential yield in the field and on into the bin.

A few imposters such as 'sunburn' on the upper canopy of soybean leaves have also stirred up a concern in local fields.

Fungicides will not only save and enhance yield, they also help increase harvest efficiencies, along with fuel savings.

As heard on KWBG-AM 1590
